

# What does a diagnosis of Myeloma mean in 2015

***Dr Aristeidis Chaidos***  
*Consultant Haematologist*  
*Hammersmith Hospital*

# Learning objectives

- define myeloma and related disorders
- diagnosis & disease monitoring
- “many myelomas”: staging & prognostic systems
- the evolving landscape in myeloma treatment
- principles of management with emphasis to care in the community
- future challenges and novel therapies

# Myeloma – overview

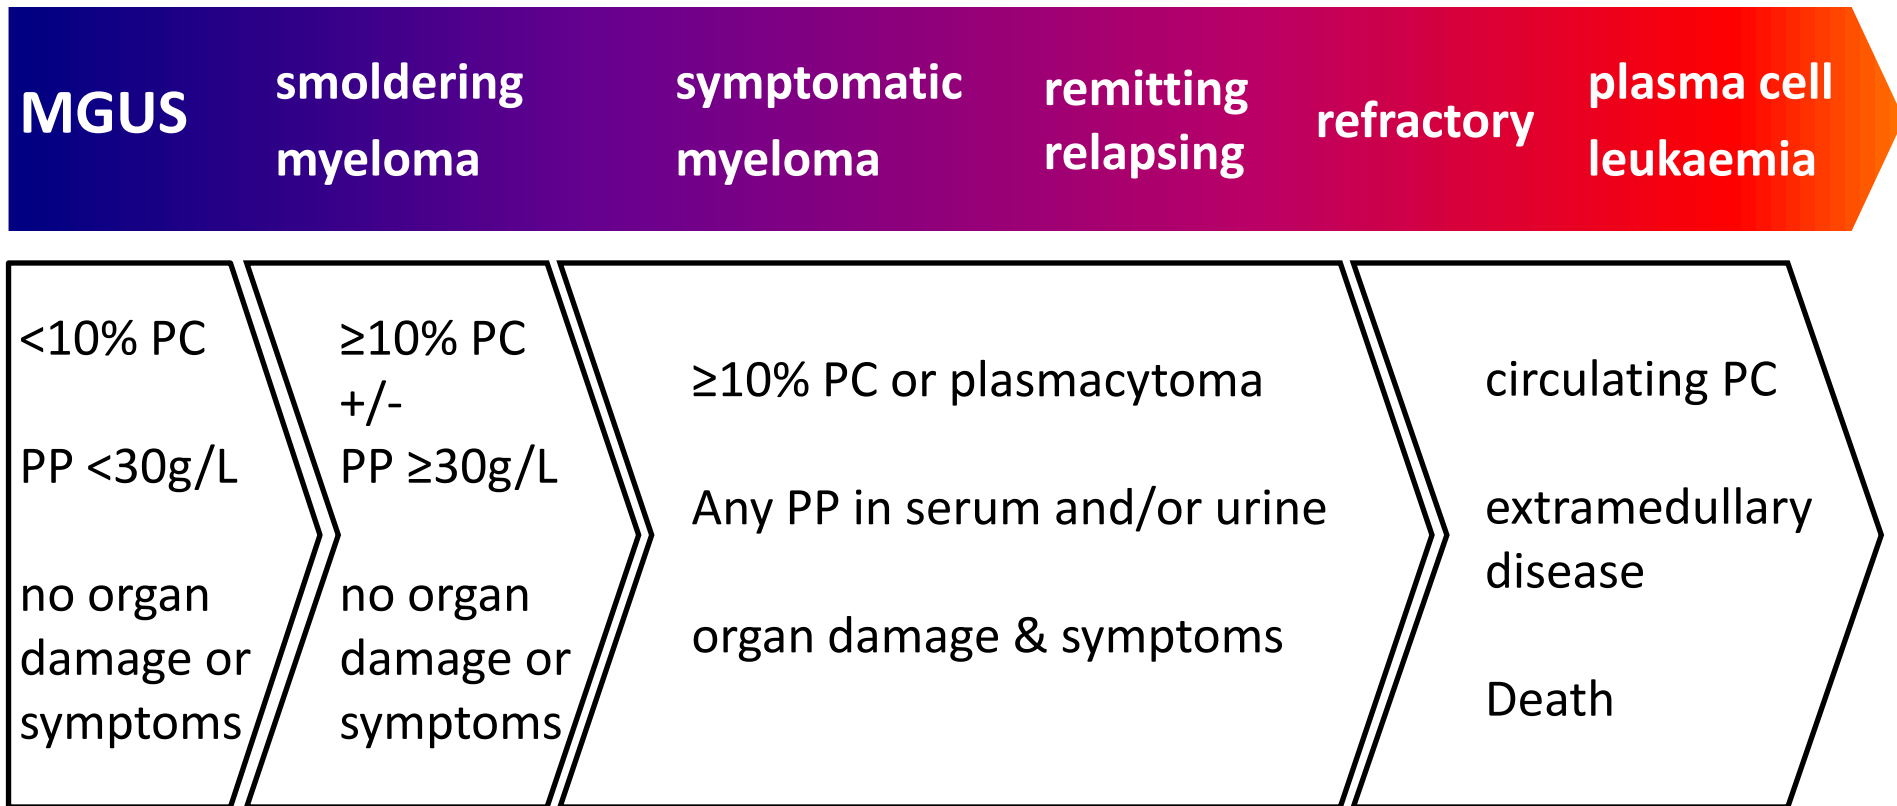

- malignancy of the plasma cells (PC): the terminally differentiated, antibody producing B cells
- myeloma cells infiltrate the bone marrow
- IgG or IgA paraprotein (PP) and/or free light chains in blood and urine
- bone destruction
- kidney damage
- anaemia
- despite great advances in the last 15 years myeloma remains an incurable disease

# Myeloma in figures

- 1% of all cancers – 13% of blood cancers
- median age at diagnosis: 67 years
- only 1% of patients <40 years
- 4 – 5 new cases per 100,000 population annually, but different among ethnic groups
- 4,800 new myeloma patients in the UK each year
- the prevalence of myeloma in the community increases with outcome improvements and aging population

# Myeloma related conditions

# MGUS

## monoclonal gammopathy of unknown significance

- The most common pre-malignant condition: 3% of individuals aged >50 yrs
- Average risk of progression 1% per year
- IgG and IgA MGUS → myeloma
- IgM MGUS → lymphoma
- Light chain MGUS → risk of kidney damage
- Overall survival MGUS vs general population: 8 vs 11 years

# MGUS: prognostic systems & management

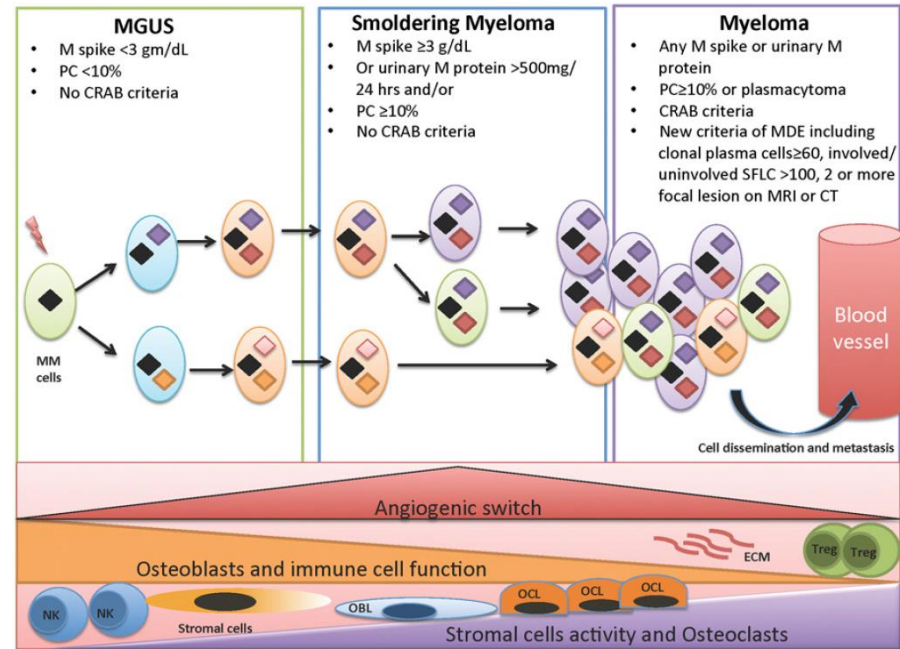

Number of risk factors	Rajkumar <i>et al.</i> (n=1148) <sup>17</sup> -Serum M-protein ≥15 g/L -non-IgG subtype -Abnormal FLC ratio		Perez-Persona <i>et al.</i> (n=276) <sup>13</sup> -≥95% aberrant bone marrow plasma cells -DNA aneuploidy		Perez-Persona <i>et al.</i> (n=311) <sup>30</sup> -≥95% aberrant bone marrow plasma cells -Evolving MGUS*	
	Risk of progression at 20 years	% of total	Risk of progression at 5 years	% of total	Risk of progression at 7 years	% of total
0	5%	39%	2%	46%	2%	49%
1	21%	37%	10%	48%	16%	45%
2	37%	20%	46%	6%	72%	6%
3	58%	5%	-	-	-	-

\*Evolving MGUS is defined as an increase of M-protein of at least 10% by the third year, confirmed by two consecutive measurements separated by at least one month.

- **Low-risk MGUS:** protein electrophoresis and serum free light chains (FLC) every 2-3 years or on myeloma-related symptoms
- **Intermediate & high-risk MGUS:** review every 6 -12 months

# Smoldering myeloma

- Heterogeneous group
- Mayo Clinic Risk Stratification:
  - BM PC  $\geq 10\%$
  - PP  $\geq 30\text{g/L}$
  - FLC ratio  $< 0.125$  or  $> 8$
- Low, intermediate risk: observation
- High risk (3 factors): ?treatment

# Symptomatic myeloma

- BM plasma cells >10% or plasmacytoma
- Organ damage: CRAB or
- Myeloma defining event
  - BM PC  $\geq$ 60% or
  - FLC ratio >100 / <0.01 or
  - 2 focal lesion in CT (PET) or MRI

## Panel: CRAB criteria for active multiple myeloma

### C: hypercalcaemia

Calcium concentration >0.25 mmol/L (>0.5 mg/dL) above normal range or >2.75 mmol/L (>10.5 mg/dL)

### R: renal insufficiency

Creatinine concentration >173 mmol/L (>2 mg/dL)

### A: anaemia

Haemoglobin concentration 20 g/L below normal range or <100 g/L

### B: bone lesions

Lytic bone lesions of osteoporosis with compression fractures

### Other features

Symptomatic hyperviscosity, amyloidosis, recurrent bacterial infections (>2 per year)

*Raab et al, The Lancet 2009*

# Clinical presentation

- Asymptomatic
- Anaemia
  - >70% of patients at presentation, normocytic
- Bone disease (80%)
  - Bone pain, lytic lesions, osteopenia, fractures, hypercalcaemia
- Renal impairment (20 - 40%)
  - Ig / light chain deposits
- Infections
  - Bacterial & viral

*Palumbo & Anderson, NEJM 2011*

# Clinical presentation

- Myeloma screening
  - FBC: Hb↓, WBC →, PLT→
  - ESR: ↑
  - Renal function
  - LFT normal, Alkaline phosphatase
  - Calcium ↑
  - Serum globulins ↑ & albumin ↓
- Serum protein electrophoresis & immunofixation
  - Paraprotein (IgG or IgA)
  - low normal Ig (immunoparesis)
- Serum free light chains
  - high level of kappa or lambda
  - abnormal ratio
- Bence-Jones protein

# Bone disease

## Imaging in myeloma

- Plain XR films
- CT scan including low-dose
- MRI
- PET CT
- Whole-body diffusion-weighted MRI

# Emergencies in Myeloma

## Cord compression

- Diagnosis & treatment within 24hrs
- MRI scan
- Dexamethasone 8mg iv + PPI
- Radiotherapy
- +/- biopsy
- Neurosurgery
- Stabilise unstable spine
- MDT management

## Hypercalcaemia

- Fluids, steroids, zoledronic acid

## Hyperviscosity

- plasmapheresis

# Prognosis & staging

## International Staging system

ISS stage	Criteria
I	Serum $\beta_2$ -microglobulin < 3.5 mg/L, serum albumin $\geq$ 3.5 g/dL
II	Not ISS stage I or III
III	Serum $\beta_2$ -microglobulin $\geq$ 5.5 mg/L

## Revised International Staging system

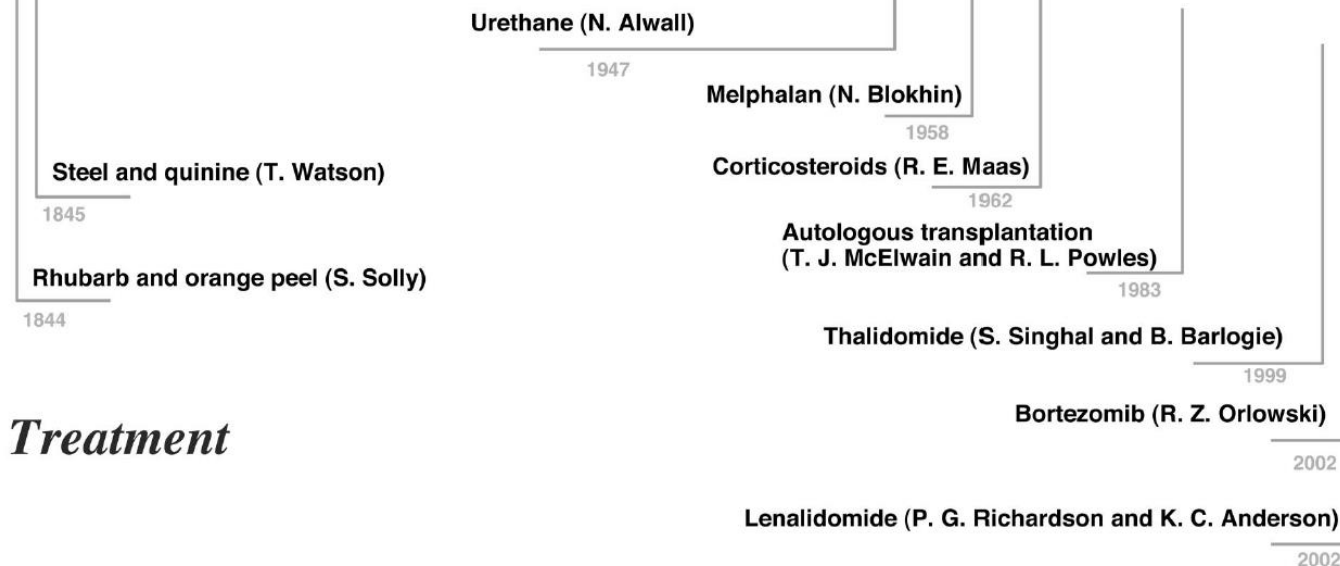

R-ISS stage	Criteria
I	ISS stage I and standard-risk CA by iFISH and normal LDH
II	Not R-ISS stage I or III
III	ISS stage III and either high-risk CA by iFISH or high LDH

Palumbo et al, JCO, August 2015

# The evolving myeloma treatment landscape

## History

## Treatment

Kyle & Rajkumar, Blood 2008

**Respect** our patients and colleagues | Encourage **innovation** in all that we do | Provide the highest quality **care** | Work together for the **achievement** of outstanding results | Take **pride** in our success

# Novel agents

## Cereblon binding molecules (immunomodulatory drugs, IMiDS)

- Thalidomide
  - Approved for first line or relapse
  - neuropathy, drowsiness, constipation, thromboembolism, teratogenicity
- Lenalidomide & Pomalidomide
  - Approved for relapse
  - Neutropenia, thrombocytopenia, thromboembolism, teratogenicity

Kortum et al. Blood Reviews 2014;99:232-242

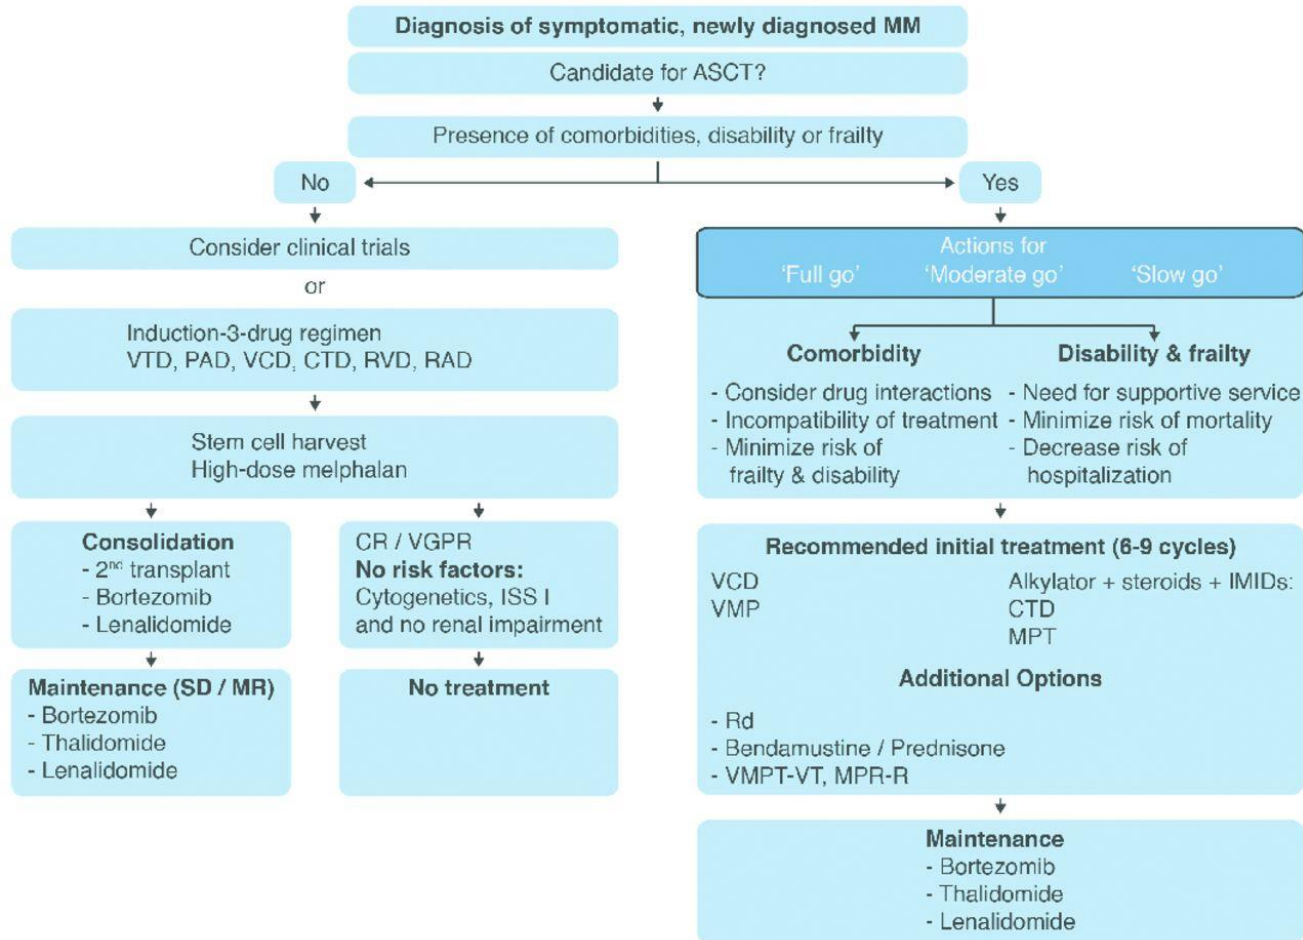

# Novel agents

## Proteasome inhibitors

- Bortezomib
  - Approved for first line or relapse
  - neuropathy, thrombocytopenia, infections (shingles), GI symptoms, rash
- Carfilzomib
  - Available in clinical trials only
  - thrombocytopenia, diarrhoea, respiratory symptoms, fever
- Ixazomib
  - Available in clinical trials only
  - Rash, liver, thrombocytopenia, neuropathy

# Current treatment approach

Engelhardt M et al. *Haematologica* 2014;99:232-242

# Supportive care – managing complications

## Bone disease - Biphosphonates

- Zoledronic acid and pamidronate
  - Both reduce skeletal-related events (pathologic fractures, cord compression, requirements for radiotherapy and surgery)
  - Zoledronic acid more effective than pamidronate
  - Oral biphosphonates (clodronate) are clearly inferior
- Patient population
  - Myeloma at all stages with bone disease
  - Maybe indicated in some patients with MGUS or smoldering myeloma
- Duration
  - At least 2 years in CR or long-term
- Hypocalcaemia
  - Vitamin D and calcium

# Supportive care – managing complications

## Bone disease - Biphosphonates

- Osteonecrosis of the jaw
  - Exposed bone in the mouth that does not heal in 6-8 weeks
  - Frequency: 4-11%, more common with zoledronic acid
  - Prevention is best strategy
  - Dental hygiene – patient education
  - Dental review before treatment
  - Avoid unnecessary dental invasive procedure
  - Interrupt treatment at least 90 days in advance of invasive dental procedures
  - if diagnosed stop biphosphonates

# Supportive care – managing complications

## Recommended vaccination 12 months post-transplant

- influenza
- polio
- Diphtheria –tetanus – pertussis
- H influenza
- Pneumococcal (PCV13 and PPV23)
- Meningococcal group C (often as Hib/MenC)
- Meningococcal group B

## DO NOT give live vaccines

- BCG
- Measles
- MMR
- Rubella
- Shingles
- Yellow fever

# Geriatric assessment predicts survival and toxicity

## Scoring system

(Katz Activity of Daily Living, Lawton Instrumental Activity of Daily Living , Charlson Comorbidity Index)

Table 3. Additive total score and related rate of OS and PFS at 3 years

Additive total score	Patient status	No. of patients (%)	% (95% CI)		Cumulative incidence at 12 mo, %	
			OS	PFS	Treatment discontinuation	Grade 3-4 nonhematologic AEs
0	Fit	340 (39)	84 (78-89)	48 (41-56)	16	22
1	Intermediate-fitness	269 (31)	76 (67-82)	41 (32-49)	21	26
≥2	Frail	260 (30)	57 (45-68)	33 (25-41)	31	34

At risk:

Fit	340	323	248	182	133	84	43
Intermediate Fitness	269	242	183	123	83	47	15
Frail	260	209	151	91	52	27	12

At risk:

Fit	340	248	167	110	70
Intermediate Fitness	269	182	108	67	41
Frail	260	142	79	42	19

Palumbo et al. Blood, January 2015

# Myeloma clinical trials

- Myeloma remains an incurable disease
- Still unclear topics in management
- Early access to novel treatments
- Allows the use of standard therapies later in the course of disease

# Myeloma clinical trials at Imperial

	MUK5 (myeloma UK)	Millenium C16019 (Millenium)	Millenium C16021 (Millenium)	Alcyone (Janssen)	BET116183 (GSK)
<b>Phase</b>	2	3	3	3	1
<b>Patient population</b>	First relapse / primary refractory	Maintenance post transplant	Maintenance in transplant ineligible	First line	Relapse - Refractory
<b>Arms</b>	Carfilzomib cyclo/dex vs Bortezomib cyclo/dex	Ixazomib vs placebo	Ixazomib vs placebo	Daratumumab + VMP vs VMP	BET762

**Respect** our patients and colleagues | Encourage **innovation** in all that we do | Provide the highest quality **care** | Work together for the **achievement** of outstanding results | Take **pride** in our success

# Ambulatory Care

Modern Management of  
Haemato-Oncology patients;  
Patient Centred care.

# Ambulatory Care

Ambulatory Care provides the opportunity for many of our patients to receive a variety of treatments, including high dose chemotherapy, without having to stay in hospital overnight.

# Advantages

Cost saving

Increase of  
capacity

Reduction of  
waiting time

Patient experience

# Day care services

Day care unit

Apheresis

# Day care services

Day care unit

Triage &  
assessment

Apheresis

Ambulatory care

# Day care services

Day care: 9 am – 5 pm, Mo-Fri

Ground floor Catherine Lewis building  
Constance Wood Ward – chemotherapy

# Day care services

Day care unit

Triage &  
assessment

Apheresis

Ambulatory care

# Day care services

Apheresis: 9 am – 5 pm + Sat/Sun prn

Red cell exchange patients

Stem cell collections

# Day care services

# AML

# AML

- Daily or 2x/day attendances during chemotherapy
- 3x/week attendances during pancytopenic phase  
– for clinical review + platelet +/- blood transfusions
- Phone calls on days off

Thank you

# Interpretation of coagulation tests

Prof Mike Laffan  
Imperial College

# Outline

- Normal coagulation / haemostasis
- The coagulation 'screen'
- Why perform coagulation screens?
- Interpretation
- Specialist coagulation tests for primary care
- Obtaining reliable results - pre-analytical factors

# Normal Haemostasis

*Response to injury*

**Vessel constriction**

**Formation of an unstable platelet plug**

-platelet adhesion +VWF  
-platelet aggregation

**Stabilisation of the plug with fibrin**

-blood coagulation

**Dissolution of clot and vessel repair**

-fibrinolysis

Coagulation screen

Anticoagulation systems

# Coagulation: 'Screening tests'

- Prothrombin time (PT)
  - Activated partial thromboplastin time (APTT)
  - Fibrinogen assay
- Thrombin time (TT)
- (Platelet count)

# Why coagulation screens?

- Detect a bleeding tendency
- Detect a cause for bleeding
- Detect a systemic disease
- Detect a thrombotic disorder
- Baseline for anticoagulation

- ❑ In fact their ability to do these is limited
  
- ❑ Coagulation screens are usually performed to detect a defect in haemostasis but
  - ❑ are unphysiological
  - ❑ test a very limited portion of haemostasis
  - ❑ have limited sensitivity & specificity

# Bleeding disorders not detected by routine clotting tests

- Mild factor deficiencies
- von Willebrand disease
- Factor XIII deficiency (cross linking)
- Platelet disorders
- Excessive fibrinolysis
- Vessel wall disorders
- Metabolic disorders (e.g. uraemia)
- Some anticoagulants

**Normal coagulation screen  $\neq$  Normal haemostasis**

# Coagulation screen and thrombotic disorders

- The coagulation screen will not detect any of the inherited thrombophilias
  - Specific tests available
  - Limited predictive value
- Current APTT reagents are insensitive to lupus anticoagulants
  - Specific testing required

**Coagulation screen: no information on thrombophilia**

# Coagulation screen and systemic disease

- Most coagulation factors are synthesised in the liver
  - PT and APTT are reasonable and sometimes important tests of liver synthetic function
- PT and APTT are sensitive to DIC
  - Usually in-patient problem

# Coagulation screen and anticoagulation

- Coagulation screen is essential baseline before beginning anticoagulation
- INR is based on the prothrombin time
  - Request specifically for calculation
- New anticoagulants may not have impact on coagulation screen.
  - Therapeutic levels reported with normal coagulation screen

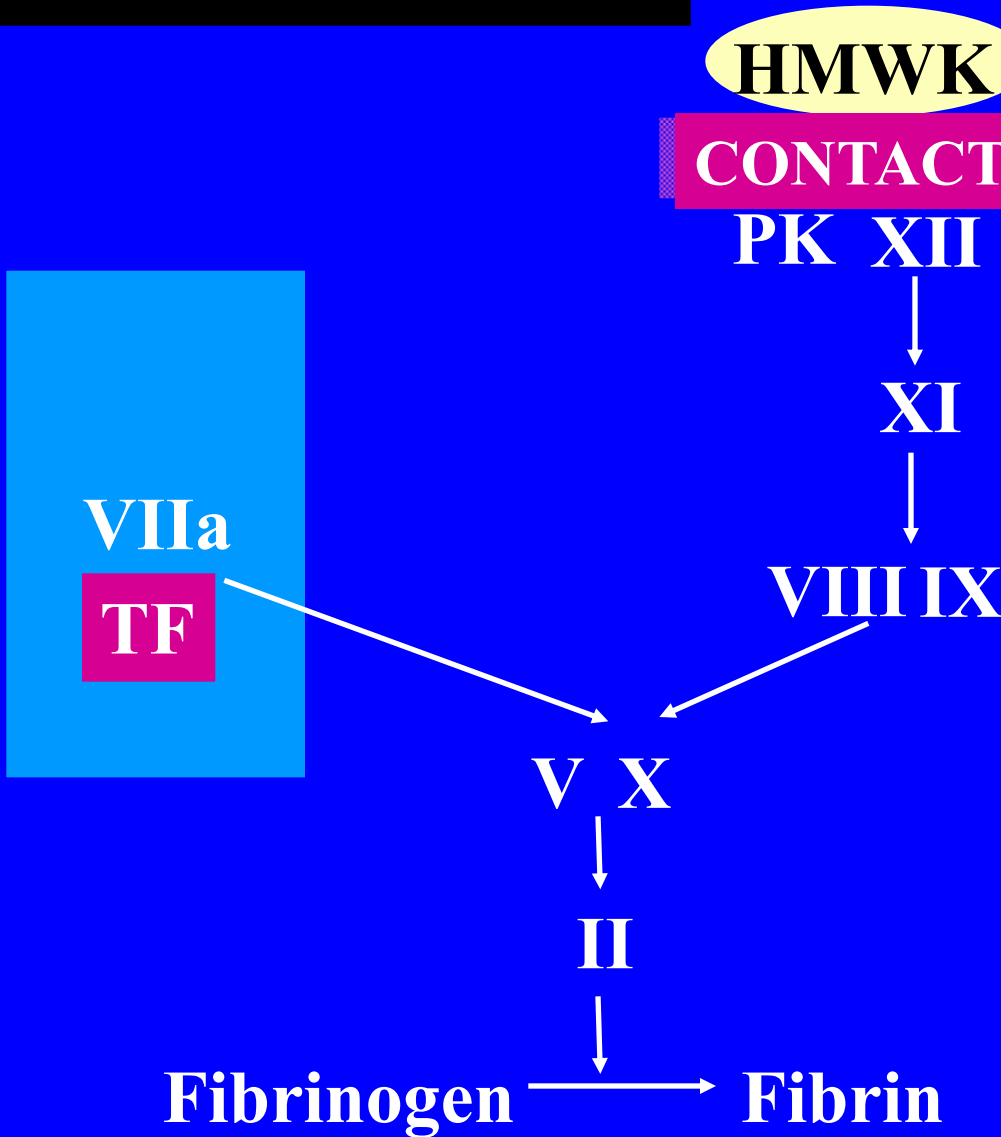

# INTERPRETATION OF COAGULATION SCREENS

PT

APTT

# PROLONGED PT

**PT 22 (9.6-11.6)**

**APTT 28 (26-32)**

**TT 16 (15-19)**

# PROLONGED PT

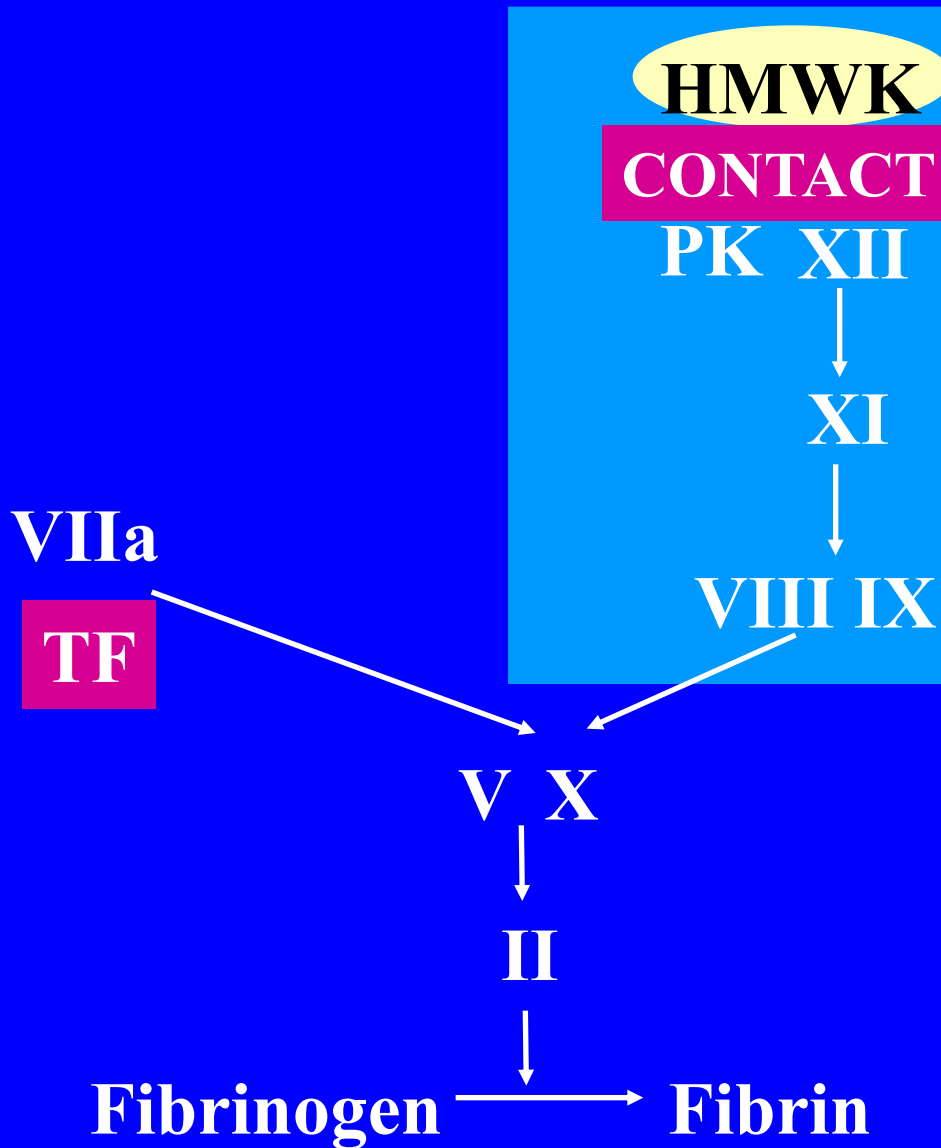

**FVII deficiency**

# PROLONGED APTT

# PROLONGED APTT

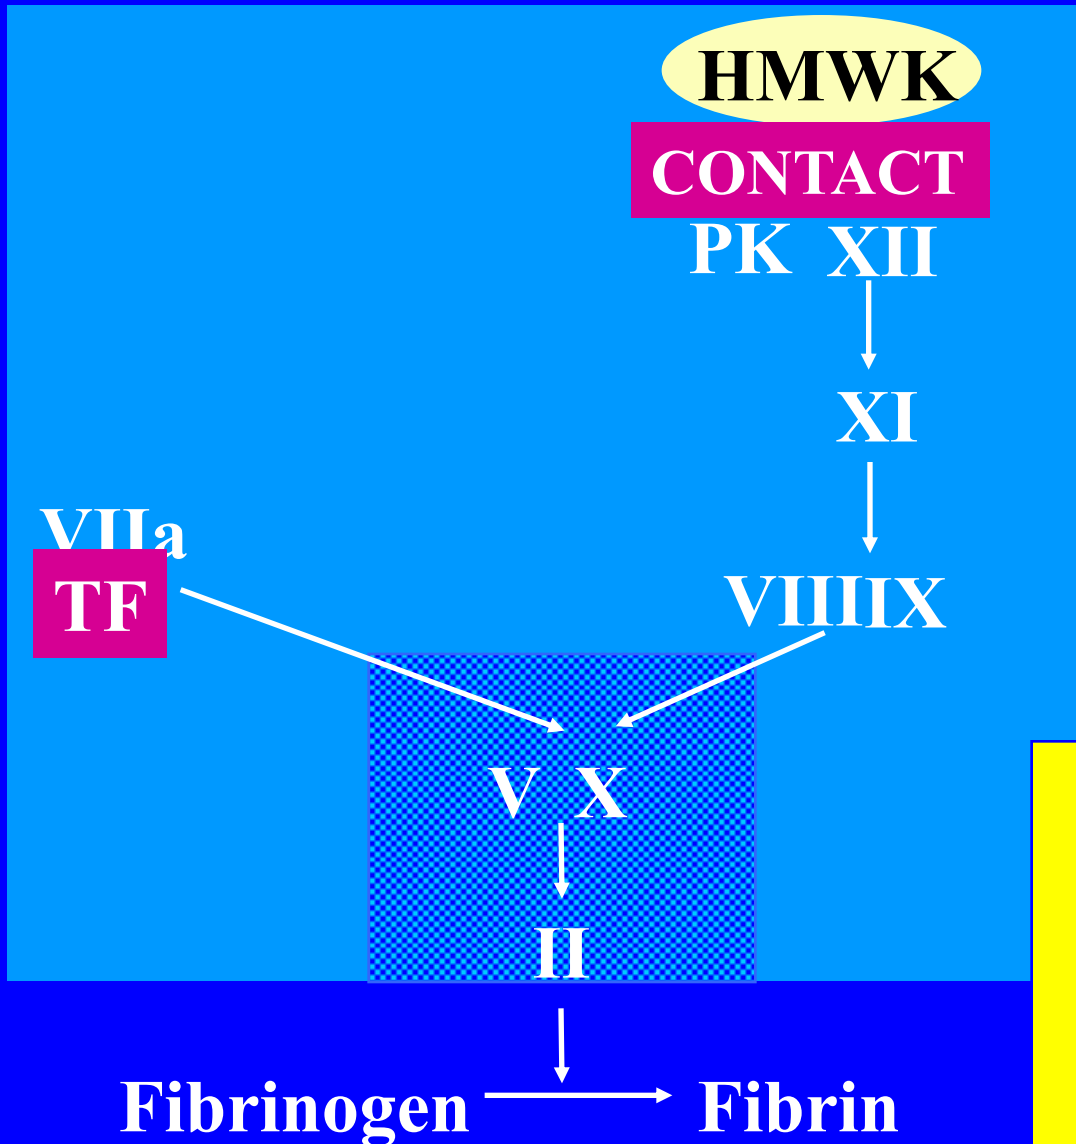

**Deficiency of  
Contact factor  
(XII, PK, HMWK)  
FXI, FIX, FVIII**

# Coagulation factor deficiencies are not all the same

- Factor VIII and IX (Haemophilia)
  - Severe but compatible with life
  - Spontaneous joint and muscle bleeding
- Prothrombin (Factor II)
  - Lethal
- Factor XI
  - Bleed after trauma but not spontaneously
- Factor XII
  - No excess bleeding at all

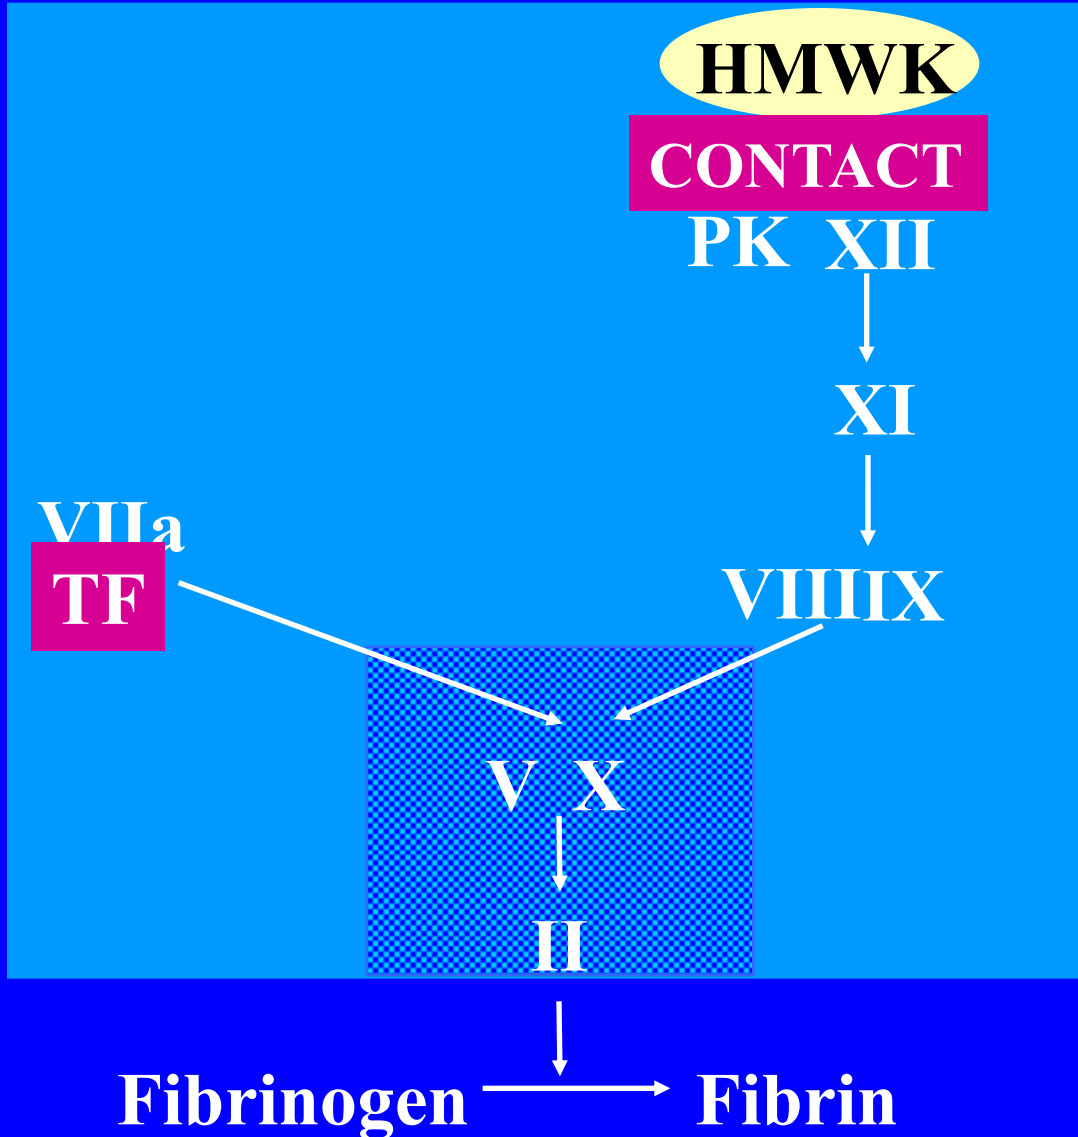

# PROLONGED APTT AND PT

<b>PT</b>	<b>19.3 (9.6-11.6)</b>
<b>APTT</b>	<b>45 (26-32)</b>
<b>TT</b>	<b>16 (15-19)</b>

# PROLONGED APTT AND PT

**Deficiency**  
**FV, FX, Prothrombin**  
**OR**  
**Multiple deficiencies**

# ALL TESTS PROLONGED + low fibrinogen

HMWK

CONTACT

PK XII

XI

VIII IX

VIIa  
TF

V X

II

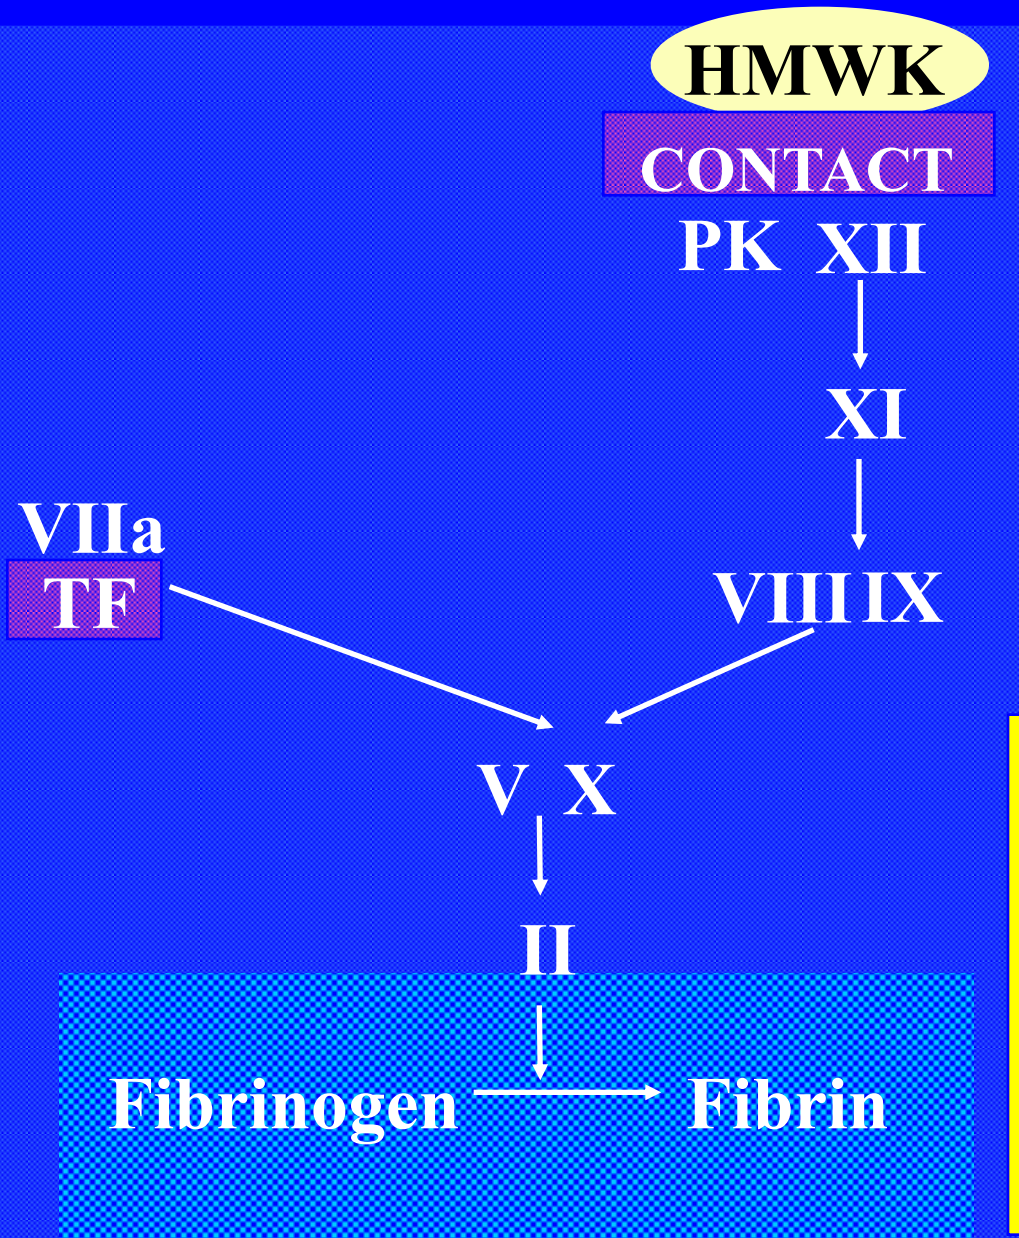

Fibrinogen → Fibrin

PT 18.5 (9.6-11.6)

APTT 45 (26-32)

Fgn 0.93g/l (1.8-3.6)

# ALL TESTS PROLONGED + low fibrinogen

**Fibrinogen deficiency**  
**Abnormal fibrinogen**  
**Multiple deficiencies**  
**Combination (DIC)**

# What can you learn from the coagulation screen?

- Significant coagulation factor deficiency
  - Children with unusual bruising/bleeding
    - Inherited factor deficiency eg haemophilia
  - Adults with new onset bleeding/bruising
    - Acquired haemophilia
    - Coagulopathy: malignancy, liver disease, DIC
- Significant synthetic defect
  - Liver disease
  - Vitamin K deficiency

# What can you learn from the coagulation screen?

- Normal baseline for anticoagulation
  - Monitoring will be reliable
  - Assist in assessing risk
- Anticoagulant effect
  - Inappropriate consumption
  - Not for monitoring

# What can you learn from the coagulation screen?

- The tests are designed to detect deficiencies, inhibitors and anticoagulants
  - Prolonged results are significant
  - Shortened results are not significant
    - May indicate problem with the sample

# Follow-up for abnormal screens

- Unexpected abnormal coagulation screen
  - Refer for further testing
- Significant symptoms and normal coagulation screen
  - Refer for further testing (platelets, VWF, f assays)
- Specialist tests are available
  - Eg coagulation factors, lupus anticoagulant, thrombophilia screens

But....

- More susceptible to pre-analytic effects
- Interpretation is complicated

# **QUALITY CONTROL AND RELIABLE RESULTS**

# PRE-ANALYTICAL VARIABLES

## How to ensure meaningful results

- Patient factors
  - Factor VIII & VWF rise with exercise
  - Haematocrit
- Blood sample collection
  - Venepuncture Technique
  - Blood sample containers
  - Choice of anticoagulant (Citrate)
  - Correct filling of tube
    - Citrate has significant volume

# PRE-ANALYTICAL VARIABLES

- Sample transport to the laboratory
  - The in vitro half-life of FVIII is 10 hours
- Centrifugation (Speed, temperature and time)
- Storage of plasma (Temperature and time)

# Underfilled, Haemolysed and a good quality citrate sample

# Summary

- Good quality sample essential
- Coagulation screen informative
  - Factor deficiency, anticoagulation, liver disease, baseline
- Normal screen  $\neq$  normal haemostasis
- No information on thrombophilia
- Shortened tests generally ignore
- Specialist tests difficult from primary care
- Coagulation consultant on call
- GP advice email
